IN THE CLAIMS

Please amend the claims as follows:

Claims 1-27 (Canceled).

Claim 28 (Currently Amended): An optical recording medium in which a write-once

or rewrite operation of data can be performed with a block including a group of data as a unit,

wherein buffer areas having a fixed length for random access are respectively

disposed before and after respective blocks,

whereby when a new block is recorded a start point for the fixed length buffer area

before the new block is not fixed relative to an existing block preceding the new block, and

the new block is recorded in a state that the fixed length buffer area provided with respect to

the new block and the fixed length buffer area provided with respect to the existing block

adjacent to the new block overlap with each other,

wherein the fixed length buffer area disposed immediately before a respective of the

blocks includes a preamble for signal processing, and plural synchronization patterns having

distances and identification information that are different from each other are recorded at the

preamble.

Claim 29 (Previously Presented): The optical recording medium as set forth in claim

29, wherein a recording unit block is constituted by a respective of the blocks and the fixed

length buffer areas before and after the respective block, and a guard area or areas is or are

provided at a rear portion of one recording unit block or at a rearmost portion of successive

plural recording unit blocks.

Claim 30 (Currently Amended): The optical recording medium as set forth in claim 28, wherein the fixed length buffer area disposed immediately before a respective of the blocks includes a guard area for overlap at a time of recording and a preamble for signal processing, and signal patterns for a frequency pull-in of a Phase Locked Loop (PLL) at a time of data reproduction and an Auto Gain Control (AGC) are recorded at the guard area or the preamble.

Claim 31 (Previously Presented): The optical recording medium as set forth in claim 28, wherein the fixed length buffer area or areas disposed immediately before or immediately after a respective of the blocks includes or include a guard area for overlap at a time of recording, and a signal pattern for automatic adjustment according to a power of a light source is recorded within the guard area.

Claim 32 (Currently Amended): The optical recording medium as set forth in claim 28, wherein the fixed length buffer area disposed immediately before a respective of the blocks includes a guard area for overlap at a time of recording and a preamble for signal processing, and plural synchronization patterns having distances and identification information that are different from each other are recorded at the preamble.

Claim 33 (Previously Presented): The optical recording medium as set forth in claim 28, wherein the fixed length buffer area disposed immediately after a respective of the blocks includes a postamble for time adjustment of signal processing and a guard area for adjustment of a recording end position, and a signal pattern for a Phase Locked Loop (PLL) according to a reproduction clock is recorded at the postamble.

Claim 34 (Previously Presented): The optical recording medium as set forth in claim 28, wherein the fixed length buffer area disposed immediately after a respective of the blocks includes a postamble for time adjustment of signal processing and a guard area for adjustment of a recording end position, and a signal pattern for detecting a reproduction end of the block is recorded at the postamble.

Claim 35 (Previously Presented): The optical recording medium as set forth in claim 30, wherein the signal pattern is a repetitive pattern of 3T/3T/2T/2T/5T/5T.

Claim 36 (Previously Presented): The optical recording medium as set forth in claim 31, wherein the signal pattern is a repetitive pattern of 3T/3T/2T/2T/5T/5T.

Claim 37 (Previously Presented): The optical recording medium as set forth in claim 33, wherein the signal pattern is a repetitive pattern of 3T/3T/2T/2T/5T.

Claim 38 (Currently Amended): An information processing apparatus adapted for performing recording or reproduction of information with respect to an optical recording medium in which a write-once or rewrite operation of data can be performed with a block including a group of data as a unit,

the information processing apparatus including data recording means for generating recording channel data in which buffer areas having a fixed length for random access are added before and after respective blocks to record the data onto an optical recording medium,

wherein when recording of a new block is started with respect to a first block that has been already recorded, a start point for the fixed length buffer area before the new block is not fixed relative to the first block preceding the new block, and the new block is recorded in a state that the fixed length buffer area disposed immediately before the new block and the fixed length buffer area provided with respect to the new block overlap with each other, and when recording of the new block is completed, the new block is recorded in a state that the fixed length buffer area disposed immediately after the new block and the fixed length buffer area disposed immediately before a next block adjacent to the new block overlap with each other,

and further comprising data reproducing means for reproducing plural

synchronization patterns recorded at a preamble for signal processing of the fixed length

buffer area disposed immediately before a respective of the blocks to establish

synchronization.

Claim 39 (Previously Presented): The information processing apparatus as set forth in claim 38, wherein recording and reproduction are performed with recording a unit block including a respective of the blocks and the fixed length buffer areas before and after the respective block as a processing unit, and a guard area or areas is or are provided at a rear portion of one recording unit block, or at a rearmost portion of successive plural recording unit blocks at a time of recording of recording channel data.

Claim 40 (Currently Amended): The information processing apparatus as set forth in claim 38, wherein the fixed length buffer area disposed immediately before a respective of the blocks includes a guard area for overlap at a time of recording, and a preamble for signal processing,

the information processing apparatus further comprising:

data reproducing means for reproducing a signal pattern recorded at the guard area or the preamble to use the signal pattern thus reproduced as a signal for a frequency pull-in of a Phase Locked Loop (PLL) and an Auto Gain Control (AGC).

Claim 41 (Previously Presented): The information processing apparatus as set forth in claim 30, further comprising:

data reproducing means for reproducing a signal pattern recorded within a guard area for overlap at a time of recording of the fixed length buffer area or areas disposed immediately before or immediately after a respective of the blocks, to use the signal pattern thus reproduced as a signal for automatic adjustment according to a power of a light source.

Claim 42 (Canceled).

Claim 43 (Previously Presented): The information processing apparatus as set forth in claim 38, further comprising:

data reproducing means for reproducing a signal pattern recorded at a postamble for time adjustment of a signal processing of the fixed length buffer area disposed immediately after a respective of the blocks to use the signal pattern thus reproduced as a Phase Locked Loop (PLL) of a reproduction clock.

Claim 44 (Previously Presented): The information processing apparatus as set forth in claim 38, further comprising:

data reproducing means for reproducing a signal pattern recorded at a postamble for time adjustment of a signal processing of the fixed length buffer area disposed immediately after a respective of the blocks to perform detection of a reproduction end according to the respective block.

Claim 45 (Currently Amended): A recording method for performing a write-once or

rewrite operation of data with a block including a group of data as a unit,

wherein buffer areas having a fixed length for random access are respectively

disposed before and after respective blocks,

whereby when a new block is recorded, a start point for the fixed length buffer area

before the new block is not fixed relative to an existing block preceding the new block, and

the new block is recorded in a state that the fixed length buffer area provided with respect to

the new block and the fixed length buffer area provided with respect to the existing block

adjacent to the new block overlap with each other,

wherein the fixed length buffer area disposed immediately before a respective of the

blocks includes a preamble for signal processing, and plural synchronization patterns having

distances and identification information that are different from each other are recorded at the

preamble.

Claim 46 (Previously Presented): The recording method as set forth in claim 45,

wherein a recording unit block is constituted by a respective of the blocks and the fixed

length buffer areas before and after the respective block, and a guard area or areas is or are

provided at a rear portion of one recording unit block or at a rearmost portion of successive

plural recording unit blocks.

Claim 47 (Previously Presented): The recording method as set forth in claim 45,

wherein the fixed length buffer area disposed immediately before a respective of the blocks

7

includes a guard area for overlap at a time of recording and a preamble for signal processing, and signal patterns for a frequency pull-in of a Phase Locked Loop (PLL) at a time of data reproduction and an Auto Gain Control (AGC) are recorded at the guard area or the preamble.

Claim 48 (Previously Presented): The recording method as set forth in claim 45, wherein the fixed length buffer area or areas disposed immediately before or immediately after a respective of the blocks includes or include a guard area for overlap at a time of recording, and a signal pattern for automatic adjustment according to a power of a light source is recorded within the guard area.

Claim 49 (Currently Amended): The recording method as set forth in claim 45, wherein the fixed length buffer area disposed immediately before a respective of the blocks includes a guard area for overlap at a time of recording and a preamble for signal processing, and plural synchronization patterns having distances and identification information that are different from each other are recorded at the preamble.

Claim 50 (Previously Presented): The recording method as set forth in claim 45, wherein the fixed length buffer area disposed immediately after a respective of the blocks includes a postamble for time adjustment of signal processing and a guard area for adjustment of a recording end position, and a signal pattern for a Phase Locked Loop (PLL) according to a reproduction clock is recorded at the postamble.

Claim 51 (Previously Presented): The recording method as set forth in claim 45, wherein the fixed length buffer area disposed immediately after a respective of the blocks

includes a postamble for time adjustment of signal processing and a guard area for adjustment of a recording end position, and a signal pattern for detecting a reproduction end of the block is recorded at the post-amble.

Claim 52 (Previously Presented): The recording method as set forth in claim 47, wherein a repetitive pattern of 3T/3T/2T/5T/5T is recorded as the signal pattern.

Claim 53 (Previously Presented): The recording method as set forth in claim 48, wherein a repetitive pattern of 3T/3T/2T/5T/5T is recorded as the signal pattern.

Claim 54 (Previously Presented): The recording method as set forth in claim 50, wherein a repetitive pattern of 3T/3T/2T/5T/5T is recorded as the signal pattern.
